GET THE BEST OUT OF YOUR MILKING PARLOUR

Dynamic milking machine testing is a real-time test, that takes place whilst the parlour is in operation, to examine the efficiency of the equipment and the overall routine. The dynamic option provides a comprehensive test of the system, but as it takes place during milking, it also provides valuable information on vacuum fluctuation, cluster position, wash cycle effectiveness, teat condition and cow flow.

WHY HAVE A DYNAMIC TEST?

- Increased insight into the efficiency of your milking parlour
- Improvements in cow welfare, milking efficiency and times
- An aid for training for you and your staff
- In order to meet the requirements of your milk contract

Kevan Windridge has over 35 years of experience milking and testing in a wide range of parlours. His knowledge allows him to provide practical advice to you and your staff to improve the efficiency of your parlour and the overall milking routine.
